BPMN AS-IS

Partner A (gives recognition)
Problem: no durable record. Consequence: either side can deny it later. To-Be: the title is issued as an NFT (D2, D3).
Problem: can be copied or forged. Consequence: no trustworthy proof. To-Be: immutable on-chain NFT (D2).
Problem: Partner A answers every check. Consequence: delays and repeated work. To-Be: no contact needed (D6).
Partnership agreed
Agree on the partnership verbally or by email
Form of recognition?
Paper
Draft a paper certificate or letter
Press
Ask the press to write an article
Send the certificate or article to Partner B
Recognition sent
Paper copy or article
Verification question received
Answer the verifier manually by phone or email (slow)
Verifier answered
Partner B (recognised)
Problem: no central record. Consequence: history is hard to trace. To-Be: Public Directory (D6).
Problem: the third party sees only a copy. Consequence: must check by hand. To-Be: look up the NFT (D6).
Certificate or article received
Receive the copy and file it locally (no central record)
Show the certificate or article to a third party when asked
Shown to third party
Certificate or article
Question
Answer
Third party (verifier)
Problem: slow, depends on Partner A. Consequence: about 1-3 days per check (estimate). To-Be: Verify on-chain in under 5 s (D6).
Problem: decision rests on unverifiable proof. Consequence: accepted but not verifiable. To-Be: result read from the chain (D6).
Certificate or article received
Check by hand: compare signature and stamp
Call or email Partner A
Receive the answer
Proof looks genuine?
Yes
Trust the paper or article (it can still be forged)
Accepted, but not verifiable
No
Doubt the claim; cannot trace the collaboration history
Partnership not recognised
Problem: nothing proves the partnership. Consequence: partnership not recognised. To-Be: NFT history on the public profile (D6).
